

Got Lightning? Get Grounded

A Lightning Protection System (LPS) Safely Routes
Lightning Into the Ground

How lightning wreaks havoc on a home

1. Roof
2. TV antenna
3. Chimney
4. Telephone or power line
5. Nearby tree
6. Garage door
7. Cable lines
8. Irrigation system
9. Gas piping

All of the Above Can Create a Pathway for Lightning's Destructive Energy!

A single lightning strike can send hundreds of millions of volts of dangerous and destructive electricity into a home.

Thousands of lightning-sparked fires occur annually in the U.S., causing fatalities and millions of dollars in property damage.

A professionally installed LPS immediately negates this harmful voltage, protecting life and property against a leading weather threat.
